Ibutton plugin – version 1.0
Yii Class Author: Junior (scoob.junior@gmail.com / junior@df9.com.br)

IButton implements the Giva Labs jQuery iButton plugin.
More info at: http://www.givainc.com/labs/ibutton_jquery_plugin.htm

IButton makes checkboxes and/or radio buttons look like Apple's "on-off" buttons
See a live demo at Live demo at http://www.givainc.com/labs/ibutton_example.htm

IButton accepts CSS selectors, so it is easy to give any checkbox or radio button the effect. It was added support for model/attribute pairs, so that you can easily integrate into your Yii's forms

Sample 1 – turn all checkboxes in the page into iButtons:

```php
<?php $this->widget('ext.ibutton.IButton', array(
        'selector'=>':checkbox',
        'options' =>array(
                'duration' => 250,
                'change'=>'js:function(){alert("ooohay! it has been changed!");}'
        )
));?>
```

Sample 2 – turn the model/attribute pair into an iButton:

```php
<?php $this->widget('ext.ibutton.IButton', array(
        'model'    => $model,
        'attribute' => 'is_master',
        'options' =>array(
                'labelOn'=>Yii::t('app','Yes'),
                'labelOff'=>Yii::t('app','No'),
                'change'=>'js:function($choice){
                        $choice.is(":checked")?alert("Hey, master!"):alert("Sorry, you
are not my master!");
                }'
        )
));?>
```

Sample 3 – turn both all radio buttons and a model/attribute pair into iButtons:

```php
<?php $this->widget('ext.ibutton.IButton', array(
        'selector'  => ':radio',
        'model'    => $model,
        'attribute' => 'is_master',
        'options' =>array(
                'labelOn'=>Yii::t('app','Yes'),
                'labelOff'=>Yii::t('app','No'),
```

```php
                    'change'=>'js:function($choice){
                            $choice.is(":checked")?alert("Check on"):alert("Check off");
                    }'
                )
        ));?>
```

Sample 4 – convert all checkboxes and radios in a form into iButtons using form:

```php
        <?php $this->widget('ext.ibutton.IButton', array(
                    'selector'  => 'form',
                    'options' =>array(
                            'labelOn'=>Yii::t('app','Yes'),
                            'labelOff'=>Yii::t('app','No')
                    )
        ));?>
```
